

Live Scores Fix Report

Generated for the FIFA World Cup 2026 live-score issue in the Vue + Laravel project.

1. What was not working

The live-score card was showing the wrong feed and the browser path was not reliable for third-party data.

- Direct browser requests to third-party live-score APIs were blocked by CORS, so the frontend could not fetch the data directly.
- The old live-score source returned 2022 World Cup matches, not the 2026 tournament data the page was supposed to show.
- The frontend card was therefore loading a feed that looked unrelated or outdated.

2. What changed

The fix was split into two real changes: use a backend proxy for external data, and switch the source to the official FIFA 2026 calendar API.

Detailed file-by-file changes:

- `backend/routes/api.php`: lines 20-64 — added the `/api/live-scores` backend proxy, switched the source to FIFA calendar API for 2026-06-11 to 2026-07-19, filtered only World Cup competitions, and normalized the returned match objects for the frontend.
- `frontend/wc_hub/src/components/LiveScores.vue`: lines 57, 109-132 — the card now calls `/api/live-scores` from the backend, normalizes score fields, renders the status text, and refreshes every 60 seconds.
- `backend/tests/Feature/LiveScoresRouteTest.php`: lines 8-43 — added a regression test that mocks the FIFA feed and verifies only the World Cup 2026 match is returned.

A. Backend proxy for live scores

The frontend now requests `/api/live-scores` from the Laravel backend instead of calling a third-party URL directly from the browser.

This change is in: `backend/routes/api.php` and the frontend consumer in `frontend/wc_hub/src/components/LiveScores.vue`.

B. FIFA 2026-specific source

The backend route now calls the FIFA calendar endpoint for 2026 and filters only matches whose competition name contains “World Cup”.

Example of the backend logic added:

```
Route::get('/live-scores', function () { $response =  
    Http::timeout(20)->get('https://api.fifa.com/api/v3/calendar/matches', [ 'language' => 'en', 'from' =>  
        '2026-06-11', 'to' => '2026-07-19', ]); $matches = collect($response->json('Results', [])) ->filter(fn
```

```
(array $match) => Str::contains(strtolower($match['CompetitionName'][0]['Description'] ?? ''), 'world cup')) ->take(6) ->values() ->all(); return response()->json($matches, $response->status()); };
```

3. Why this works

The two fixes address the actual failure points:

- CORS is avoided because the browser only talks to the local Laravel backend, not the third-party FIFA endpoint directly.
- The data is now correct because the backend uses the official FIFA 2026 calendar feed instead of the older 2022 source.
- The filter guarantees the card only shows World Cup competition matches, which removes unrelated fixtures.

4. Verification evidence

These checks were run after the fix:

- php artisan test --filter=LiveScoresRouteTest → 1 passed, 6 assertions
- npm run build → Vite production build completed successfully
- curl http://127.0.0.1:8000/api/live-scores → returned 3 FIFA World Cup 2026 matches, starting with Mexico vs South Africa

5. Result

The live-score section now works with the correct FIFA World Cup 2026 match data. The issue was not only the network path; it was also the fact that the source itself was not the 2026 tournament feed.

Files involved: backend/routes/api.php (changed), frontend/wc_hub/src/components/LiveScores.vue (used by UI), backend/tests/Feature/LiveScoresRouteTest.php (created for verification).
